Lab 7

Fuzzing for Input Validation Bugs

L6_L7_42 - Salon Booking

Tool: Hypothesis (property-based fuzz testing for Python)

Repository: github.com/akshat-k30/SE-Lab6-L6_L7_42_salon_booking

Step 2: Run the Buggy Application

Command: python salon_booking.py

The buggy code runs fine with well-formed inputs but has NO input validation. It will crash on None, empty strings, missing delimiters, or non-numeric values.

```
PS> python salon_booking.py
==== Running parse_booking ====
Enter service:duration in min (e.g. haircut:45): Service and Duration: ('Haircut', 45.0)

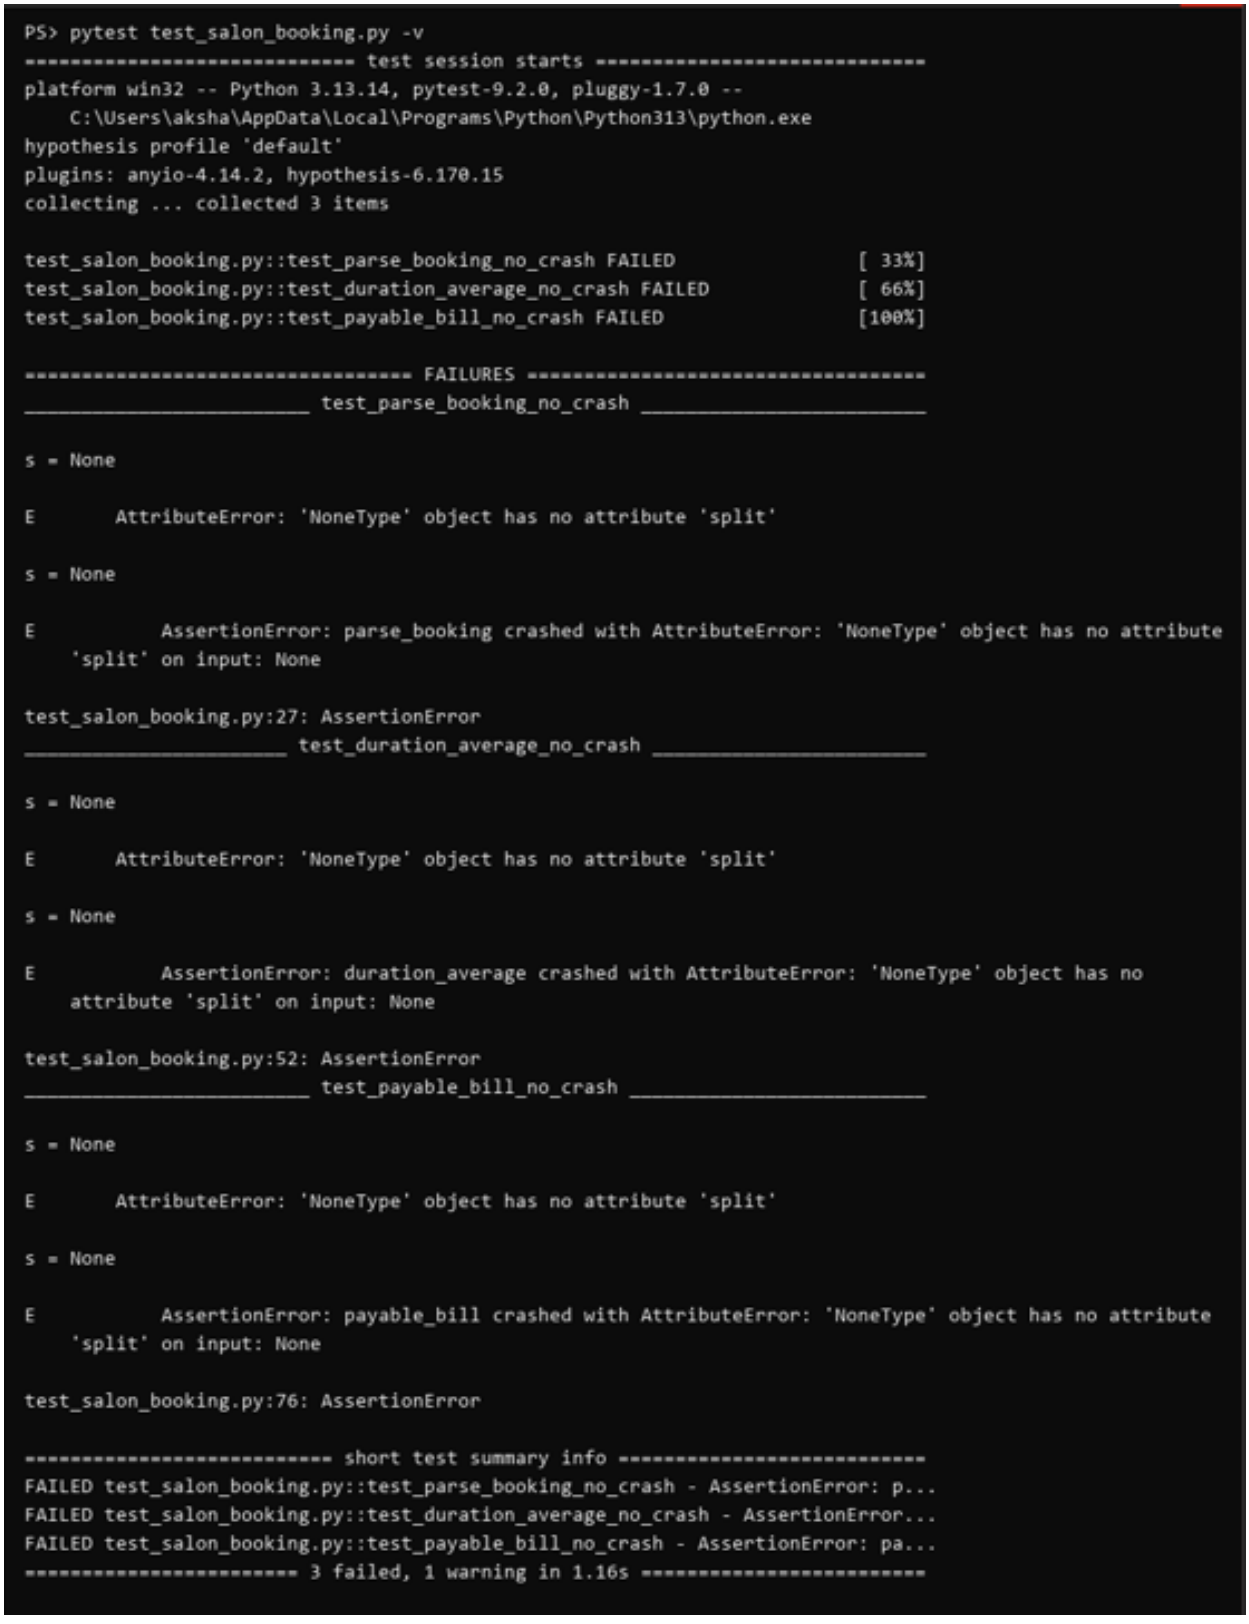

==== Running duration_average ====
Enter durations as CSV (e.g. 30,45,60): Average Duration: 45

==== Running payable_bill ====
Enter bill|discount (e.g. 800|100): Payable Bill: 844.0
```

Step 4: Run Fuzz Tests Against Buggy Code - ALL FAILING

Command: pytest test_salon_booking.py -v
Hypothesis generates random inputs (including None). All 3 tests FAIL with AttributeError because the buggy functions call .split() on None.

Note: The full pytest output is very long; the screenshot below shows the condensed key lines (header, FAILED markers, error types, and summary).

```
PS> pytest test_salon_booking.py -v
============================= test session starts =============================

======================== 3 failed, 1 warning in 1.16s =========================
```

Step 5: Run the Fixed Application

Command: python salon_booking.py

All three functions have been hardened with type checks, delimiter validation, empty-value detection, numeric parsing guards, and range validation. The fixed code produces the same correct output for valid inputs.

```
PS> python salon_booking.py
==== Running parse_booking ====
Enter service:duration in min (e.g. haircut:45): Service and Duration: ('Haircut', 45.0)

==== Running duration_average ====
Enter durations as CSV (e.g. 30,45,60): Average Duration: 45

==== Running payable_bill ====
Enter bill|discount (e.g. 800|100): Payable Bill: 844.0
```

Step 6: Re-Run Fuzz Tests Against Fixed Code - ALL PASSING

Command: pytest test_salon_booking.py -v

All 3 Hypothesis fuzz tests now PASS. The fixed code correctly handles every edge case by raising ValueError instead of crashing.

```
PS> pytest test_salon_booking.py -v

Summary of Bugs Found and Fixes Applied

Bugs Discovered via Fuzz Testing:

1. parse_booking(None) --> AttributeError (no null check)
2. parse_booking('haircut') --> ValueError (missing ':' delimiter)
3. parse_booking('haircut:abc') --> ValueError (non-numeric duration)
4. parse_booking(':45') --> returns empty service name
5. duration_average(None) --> AttributeError (no null check)
6. duration_average('') --> ZeroDivisionError (empty list, div by zero)
7. duration_average('30,,60') --> ValueError (empty CSV element)
8. duration_average('30,abc,60') --> ValueError (non-integer value)
9. payable_bill(None) --> AttributeError (no null check)
10. payable_bill('800') --> ValueError (missing '|' delimiter)
11. payable_bill('abc|100') --> ValueError (non-numeric bill)

Fixes Applied (Defensive Programming):

- Type checking: reject None and non-string inputs with ValueError
- Delimiter validation: check for required separators (':', ',', '|')
- Empty value detection: reject empty fields after splitting
- Numeric parsing guards: try/except around int()/float() conversions
- Range validation: reject negative durations, negative bills
- Graceful error handling in main() with try/except for user input

Result:

All 3 Hypothesis fuzz tests pass. The functions now handle every edge case gracefully - returning correct results for valid inputs and raising ValueError with descriptive messages for invalid inputs. No unhandled exceptions remain.
